

1. in terminal, navigate to the folder you want to use
2. `git init` (just do this once per project)
3. make some files and put them in the directory
4. `git add .` (the dot says to add all the files in the directory and below)  
Or use: `git add README.md` (adds just one file) (this stages the files)
5. `git commit -m "commit message"`  
(summarize what changes you made, be specific in present tense; you are committing these files to a certain version)
6. change your file and save it in sublime text
7. `git status` (check to see if you have made changes since the last commit)
8. `git add <filename>`
9. `git commit` (creates a commit(SAVE GAME))
10. `git log`: Displays the commits along with messages.
11. go to github and make a new repository on github
12. link github repository to your computer's local repository:  
`git remote add origin https://github.com/USERNAME/REPO_NAME.git`  
`git push -u origin master`
13. `git push origin master`
14. `git push`
15. `git pull origin master`
16. `git pull`
